Description

DS Performance pads are track day parts that bring racing technology to the road. These brake pads have a thermal under-layer between the friction material and the backing plate, to help dissipate heat during high speed braking. This prevents problems often associated with extreme conditions, such as overheating, damaged calliper seals and brake fade.

They also have excellent water recovery characteristics that allow you to regain optimum efficiency quickly - without losing control. Built-in anti-corrosive properties ensure there is no danger of brake seizure.

DS Performance line which is specifically designed for tuners and track day enthusiasts .

Delivering brake performance usually associated with the racetrack, these brake pads bring tuners all the benefit of our racing know-how and experience for daily use on the road. Ferodo DS Performance brake pads give both low and high speed braking efficiency, reduced stopping distances and great control.

You can be confident that our high performance brake pads undergo rigorous testing and development, from laboratory and dynamometer testing cycles to race circuit and road trial

- Track day & light race use for all vehicle types
- Road style refinement but with race material ability to withstand heat.
- Average friction coefficient of 0.42 over working temperature range of 20°-500°C

Applicable to:

-Civic 2015+ FK2 Type R Turbo
